Problems: 2.11 F, 2.12  
extra: 2.15 a-c

## Chapter 2 exercises

2.11: Example:

$\$ \overbrace{2,345}^{\text{constant groups}} \cdot \overbrace{67}^{\text{2 max}}$   
0 or more

$S \rightarrow \$ \text{expr}$

$\text{expr} \rightarrow ^*(0 | \text{num}) ( \epsilon | \text{int} | \text{int int} | \text{group}^* ) ( \epsilon | \cdot \text{int int} )$

$\text{Group} \rightarrow , \text{int int int}$

$\text{int} \rightarrow 0 | \text{num}$

$\text{num} \rightarrow 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9$

2.12

a) This language represents a sequence of a's and b's

b) abane

abaaE

abaaEA

abaaEA

abAA

AAE

AAM

AS

AE M

AEM

AM

S

G

2.15 a-c

a) This grammar describes a string with pairs of balanced  $()$  parentheses, but right  $)$  brackets that close multiple left  $($  parentheses.

b)  $\uparrow$

$\epsilon()()$

$(L)()()$

$(L)()()$

$\epsilon N()$

$G N()$

$G(\epsilon)$

$G(E)$

$G B$

$G$

c) Right derivation (work the last problem backwards)

$G \Rightarrow G B$   
 $\Rightarrow G(\epsilon)$   
 $\Rightarrow G()$   
 $\Rightarrow G N()$   
 $\Rightarrow G(L)()$   
 $\Rightarrow G(L)()()$   
 $\Rightarrow G((L)())$   
 $\Rightarrow ((L)())$

$G \Rightarrow^* ((L)())$
